

MindSpan

The path to maintaining a healthy brain

Research

Discovery

Early Detection

Early detection is the key to maintaining a healthy brain.

MindSpan is a research study to see if smell testing can detect changes that may be occurring in the brain.

FAST FACTS

Successful aging means maintaining a healthy brain

- Loss of sense of smell may be an early clue that neurological disease may occur later in life.
- By the time the typical symptoms of neurological disease occur, significant changes in the brain have already taken place.
- By using smell testing in combination with other tests we hope to develop a system that will detect disease before it starts.

You may be eligible to participate if:

- Your age is 50 years or older.
- You don't have a diagnosis of a neurological disorder such as Parkinson disease.
- You don't have a diagnosis of Alzheimer or other form of dementia.

Why Participate?

To partner with researchers dedicated to advancing healthy aging.

To be at the forefront of developments that may result from this important research.

To have the opportunity to undergo a neurologic exam by experts in the field.
